

Configuration Examples

The repository includes a few example JSON files under examples/ to help you get the training pipeline running quickly.

dataset_roots.example.json

Use this as the starting point for local training runs. It includes:

- daic_woz_root
- meld_root
- ravdess_root
- manifest_dir
- ravdess_frames_dir
- comorbidity_balanced_manifest
- comorbidity_target_rows

The comorbidity bootstrapped manifest now defaults to tmp_datasets/comorbidity_60k.csv, with comorbidity_target_rows set to

Why that path:

- the repository had a locked data/manifests/comorbidity_balanced.csv file in this workspace
- tmp_datasets/ is writable and safe for regenerated pipeline artifacts
- the training pipeline and README now both point to that writable location by default

dataset_roots_and_federated.example.json

Use this when you want the same dataset roots plus a federated training example.

It includes the same writable manifest path so federated and non-federated runs stay aligned.

Local Copies

When you copy the examples to a local file, you can adjust the dataset roots and leave the writable manifest path as-is:

```
Copy-Item examples\dataset_roots.example.json examples\dataset_roots.local.json
```

```
Copy-Item examples\dataset_roots_and_federated.example.json examples\dataset_roots_and_federated.local.json
```

If the locked CSV issue is resolved later, you can point comorbidity_balanced_manifest back to data/manifests/comorbidity_balanced.csv

Notes on Current Training Priorities

The training pipeline currently treats:

- text_transformer as the primary text bundle,

- audio as the primary audio bundle,
- image_dl as the primary image bundle,
- comorbidity as a downstream head that should be retrained after the upstream modalities stabilize.
